SQL Server Connection Troubleshooting

AI DataOps Agent • Local SQL Server Express • 18 October 2026

Issue

DBeaver initially timed out when connecting to the named instance **SQLEXPRESS03**. The error referenced SQL Server Browser discovery / UDP 1434. The Python application and sqlcmd could connect locally, but the initial DBeaver JDBC connection could not reach the instance over TCP/IP.

Investigation and resolution

1	Confirmed the SQL Server service **SQL Server (SQLEXPRESS03)** was running.
2	Checked the instance registry settings. TCP/IP was disabled (Enabled = 0).
3	Enabled TCP/IP in SQL Server Configuration Manager and restarted the SQL Server service.
4	Read the instance's IPAll settings. The configured dynamic TCP port was **63226**.
5	Configured DBeaver to connect directly to localhost:63226 and database dataops_sim, avoiding named-instance discovery.

Final outcome

Connection successful. DBeaver now shows the dataops_sim connection at localhost:63226, and the SQL editor successfully queried dbo.incident_records. The result returned one existing incident, INC-0001, category pipeline_failure, status resolved. Its scenario_id is NULL. This confirms DBeaver connectivity, but does not yet confirm the earlier SQL Server incident-recording fix or the current scenario state.

Screenshot evidence

Screenshot 1 — Final DBeaver query result (embedded below): connection is active and the incident query returns INC-0001. **Other troubleshooting evidence from the session:** Configuration Manager showed the SQL Server service running; PowerShell showed TCP/IP initially disabled; the IPAll registry query returned dynamic port 63226; and DBeaver's connection tree displayed dataops_sim — localhost:63226. Those earlier screenshots are referenced in this report but are not embedded because only the final DBeaver screenshot was available as a file.

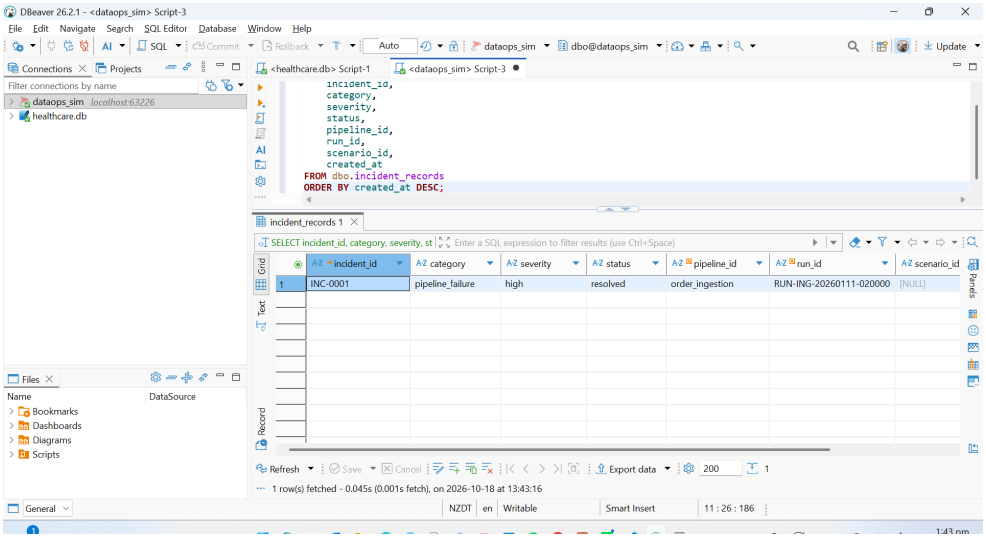

Figure 1. DBeaver connected to dataops_sim; incident_records query output.

Next action: continue with read-only inspection of pipeline_runs and incident_records before deciding whether to preserve evidence or reset the simulation database.
